

TL1963A-xx 1.5-A Low-Noise Fast-Transient-Response Low-Dropout Regulator

1 Features

- Optimized for Fast Transient Response
- Output Current: 1.5 A
- Dropout Voltage: 340 mV
- Low Noise: 40 μV_{RMS} (10 Hz to 100 kHz)
- 1-mA Quiescent Current
- No Protection Diodes Needed
- Controlled Quiescent Current in Dropout
- Fixed Output Voltages: 1.5 V, 1.8 V, 2.5 V, 3.3 V
- Adjustable Output from 1.21 V to 20 V (TL1963A Only)
- Less Than 1- μA Quiescent Current in Shutdown
- Stable With 10- μF Ceramic Output Capacitor
- Reverse-Battery Protection
- Reverse-Current Protection

2 Applications

- Industrial
- Wireless Infrastructure
- Radio-Frequency Systems
- 3.3-V to 2.5-V Logic Power Supplies
- Post Regulator for Switching Supplies

3 Description

The TL1963A-xx devices are low-dropout (LDO) regulators optimized for fast transient response. The device can supply 1.5 A of output current with a dropout voltage of 340 mV. Operating quiescent current is 1 mA, dropping to less than 1 μA in shutdown. Quiescent current is well controlled; it does not rise in dropout as with many other regulators. In addition to fast transient response, the TL1963A-xx regulators have very low output noise, which makes them ideal for sensitive RF supply applications.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TL1963A	SOT (6)	6.50 mm × 3.50 mm

5 Description (continued)

Output voltage range is from 1.21 V to 20 V. The TL1963A-xx regulators are stable with output capacitance as low as 10 μF . Small ceramic capacitors can be used without the necessary addition of ESR as is common with other regulators. Internal protection circuitry includes reverse-battery protection, current limiting, thermal limiting, and reverse-current protection. The devices are available in fixed output voltages of 1.5 V, 1.8 V, 2.5 V, 3.3 V, and as an adjustable device with a 1.21-V reference voltage.

6 Device Comparison Table

DEVICE	OUTPUT VOLTAGE	PIN 5 (DCQ AND KTT ONLY)
TL1963A	Adjustable	ADJ
TL1963A-15	1.5 V	SENSE
TL1963A-18	1.8 V	SENSE
TL1963A-25	2.5 V	SENSE
TL1963A-33	3.3 V	SENSE

7 Pin Configuration and Functions

Pin Functions

PIN				I/O	DESCRIPTION
NAME	DCQ	DCY	KTT		
ADJ	5	—	5	I	Adjust. For the adjustable TL1963A, this is the input to the error amplifier. This pin is clamped internally to ± 7 V. It has a bias current of 3 μ A that flows into the pin. The ADJ pin voltage is 1.21 V referenced to ground, and the output voltage range is 1.21 V to 20 V.
GND	3, 6	2, 4	3	—	Ground
IN	2	1	2	I	Input. Power is supplied to the device through the IN pin. A bypass capacitor is required on this pin if the device is more than six inches away from the main input filter capacitor. In general, the output impedance of a battery rises with frequency, so it is advisable to include a bypass capacitor in battery-powered circuits. A bypass capacitor (ceramic) in the range of 1 μ F to 10 μ F is sufficient. The TL1963A-xx regulators are designed to withstand reverse voltages on the IN pin with respect to ground and the OUT pin. In the case of a reverse input, which can happen if a battery is plugged in backwards, the device acts as if there is a diode in series with its input. There is no reverse-current flow into the regulator, and no reverse voltage appears at the load. The device protects both itself and the load.
OUT	4	3	4	O	Output. The output supplies power to the load. A minimum output capacitor (ceramic) of 10 μ F is required to prevent oscillations. Larger output capacitors are required for applications with large transient loads to limit peak voltage transients.
SENSE	5	—	5	I	Sense. For fixed voltage versions of the TL1963A-xx (TL1963A-1.5, TL1963A-1.8, TL1963A-2.5, and TL1963A-3.3), the SENSE pin is the input to the error amplifier. Optimum regulation is obtained at the point where the SENSE pin is connected to the OUT pin of the regulator. In critical applications, small voltage drops are caused by the resistance (R_p) of PC traces between the regulator and the load. These may be eliminated by connecting the SENSE pin to the output at the load as shown in Figure 32 . Note that the voltage drop across the external PCB traces adds to the dropout voltage of the regulator. The SENSE pin bias current is 600 μ A at the rated output voltage. The SENSE pin can be pulled below ground (as in a dual supply system in which the regulator load is returned to a negative supply) and still allow the device to start and operate.
$\overline{\text{SHDN}}$	1	—	1	I	Shutdown. The $\overline{\text{SHDN}}$ pin is used to put the TL1963A-xx regulators into a low-power shutdown state. The output is off when the $\overline{\text{SHDN}}$ pin is pulled low. The $\overline{\text{SHDN}}$ pin can be driven either by 5-V logic or open-collector logic with a pullup resistor. The pullup resistor is required to supply the pullup current of the open-collector gate, normally several microamperes, and the $\overline{\text{SHDN}}$ pin current, typically 3 μ A. If unused, the $\overline{\text{SHDN}}$ pin must be connected to V_{IN} . The device is in the low-power shutdown state if the $\overline{\text{SHDN}}$ pin is not connected.
Thermal Pad	—	—	—	—	For the KTT package, the exposed thermal pad is connected to ground and must be soldered to the PCB for rated thermal performance.

8 Specifications

8.1 Absolute Maximum Ratings

 over operating virtual-junction temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Input voltage, V_{IN}	IN	-20	20	V
	OUT	-20	20	
	Input-to-output differential ⁽²⁾	-20	20	
	SENSE	-20	20	
	ADJ	-7	7	
	$\overline{\text{SHDN}}$	-20	20	
Output short-circuit duration, t_{short}		Indefinite		
Maximum lead temperature (10-s soldering time), T_{lead}		300		°C
Maximum junction temperature, T_{JMAX}		125		°C
Storage temperature, T_{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to conditions beyond the recommended operating maximum for extended periods may affect device reliability.
- (2) Absolute maximum input-to-output differential voltage cannot be achieved with all combinations of rated IN pin and OUT pin voltages. With the IN pin at 20 V, the OUT pin may not be pulled below 0 V. The total measured voltage from IN to OUT can not exceed ± 20 V.

8.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{IN}	Input voltage range ⁽¹⁾	$V_{\text{OUT}} + V_{\text{DO}}$	20	V
V_{IH}	SHDN High-Level Input Voltage	2	20	V
V_{IL}	SHDN Low-Level Input Voltage		0.25	V
T_J	Recommended operating junction temperature range	-40	125	°C

- (1) TL1963A, TL1963A-15, and TL1963A-18 may require a higher minimum input voltage under some output voltage/load conditions as indicated under *Electrical Characteristics*.

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾⁽²⁾	TL1963A-xx			UNIT
	KTT	DCQ	DCY	
	5 PINS	6 PINS	4 PINS	
$R_{\theta JA}$ Junction-to-ambient thermal resistance	32.9	50.5	57.9	°C/W
$R_{\theta JC(\text{top})}$ Junction-to-case (top) thermal resistance	37.6	31.1	38.6	
$R_{\theta JB}$ Junction-to-board thermal resistance	18.9	5.1	7.1	
Ψ_{JT} Junction-to-top characterization parameter	5.7	1.0	1.7	
Ψ_{JB} Junction-to-board characterization parameter	17.3	5.0	7.0	
$R_{\theta JC(\text{bot})}$ Junction-to-case (bottom) thermal resistance	1.0	—	—

- (1) The TL1963A-xx regulators are tested and specified under pulse load conditions such that $T_J \neq T_A$. They are fully tested at $T_A = 25$ °C. Performance at -40 and 125 °C is specified by design, characterization, and correlation with statistical process controls.
- (2) Typical values represent the likely parametric nominal values determined at the time of characterization. Typical values depend on the application and configuration and may vary over time. Typical values are not ensured on production material.
- (3) The TL1963A is tested and specified for these conditions with the ADJ pin connected to the OUT pin.
- (4) For the TL1963A, TL1963A-15 and TL1963A-18, dropout voltages are limited by the minimum input voltage specification under some output voltage/load conditions.
- (5) Operating conditions are limited by maximum junction temperature. The regulated output voltage specification does not apply for all possible combinations of input voltage and output current. When operating at maximum input voltage, the output current range must be limited. When operating at maximum output current, the input voltage range must be limited.

Electrical Characteristics (continued)

		TL1963A-33	$V_{OUT} = 3.3$ V, $V_{IN} < 3.3$ V	25°C		600	1200	
		TL1963A	$V_{OUT} = 1.21$ V, $V_{IN} < 1.21$ V	25°C		300	600	

(6) Dropout voltage is the minimum input to output voltage differential needed to maintain regulation at a specified output current. In dropout, the output voltage is equal to: $V_{IN} - V_{DROPOUT}$.

(7) To satisfy requirements for minimum input voltage, the TL1963A is tested and specified for these conditions with an external resistor divider (two 4.12-k Ω resistors) for an output voltage of 2.4 V. The external resistor divider adds a 300- μ A DC load on the output.

(8) GND pin current is tested with $V_{IN} = (V_{OUT(NOMINAL)} + 1$ V) and a current source load. The GND pin current decreases at higher input voltages.

(9) ADJ pin bias current flows into the ADJ pin.

(10) Reverse output current is tested with the IN pin grounded and the OUT pin forced to the rated output voltage. This current flows into the OUT pin and out the GND pin.

9 Detailed Description

9.1 Overview

The TL1963A-xx series are 1.5-A low-dropout regulators optimized for fast transient response. The devices can supply 1.5 A at a dropout voltage of 340 mV. The low operating quiescent current (1 mA) drops to less than 1 μ A in shutdown. In addition to the low quiescent current, the TL1963A-xx regulators incorporate several protection features that make them ideal for use in battery-powered systems. The devices are protected against both reverse input and reverse output voltages. In battery-backup applications where the output can be held up by a backup battery when the input is pulled to ground, the TL1963A-xx acts as if it has a diode in series with its output and prevents reverse-current flow. Additionally, in dual-supply applications where the regulator load is returned to a negative supply, the output can be pulled below ground by as much as $(20\text{ V} - V_{IN})$ and still allow the device to start and operate.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Overload Recovery

Like many IC power regulators, the TL1963A-xx has safe operating area protection. The safe area protection decreases the current limit as input-to-output voltage increases and keeps the power transistor inside a safe operating region for all values of input-to-output voltage. The protection is designed to provide some output current at all values of input-to-output voltage up to the device breakdown.

When power is first turned on, as the input voltage rises, the output follows the input, allowing the regulator to start up into very heavy loads. During start-up, as the input voltage is rising, the input-to-output voltage differential is small, allowing the regulator to supply large output currents. With a high input voltage, a problem can occur wherein removal of an output short does not allow the output voltage to recover. Other regulators also exhibit this phenomenon, so it is not unique to the TL1963A-xx.

Feature Description (continued)

The problem occurs with a heavy output load when the input voltage is high and the output voltage is low. Common situations occur immediately after the removal of a short circuit or when the shutdown pin is pulled high after the input voltage has already been turned on. The load line for such a load may intersect the output current curve at two points. If this happens, there are two stable output operating points for the regulator. With this double intersection, the input power supply may need to be cycled down to zero and brought up again to make the output recover.

9.3.2 Output Voltage Noise

The TL1963A-xx regulators have been designed to provide low output voltage noise over the 10-Hz to 100-kHz bandwidth while operating at full load. Output voltage noise is typically $35 \text{ nV}/\sqrt{\text{Hz}}$ over this frequency bandwidth for the TL1963A (adjustable version). For higher output voltages (generated by using a resistor divider), the output voltage noise is gained up accordingly. This results in RMS noise over the 10-Hz to 100-kHz bandwidth of $14 \mu\text{V}_{\text{RMS}}$ for the TL1963A, increasing to $38 \mu\text{V}_{\text{RMS}}$ for the TL1963A-33.

Higher values of output voltage noise may be measured when care is not exercised with regard to circuit layout and testing. Crosstalk from nearby traces can induce unwanted noise onto the output of the TL1963A-xx. Power-supply ripple rejection must also be considered; the TL1963A-xx regulators do not have unlimited power-supply rejection and pass a small portion of the input noise through to the output.

9.3.3 Protection Features

The TL1963A-xx regulators incorporate several protection features which make them ideal for use in battery-powered circuits. In addition to the normal protection features associated with monolithic regulators, such as current limiting and thermal limiting, the devices are protected against reverse input voltages, reverse output voltages and reverse voltages from output to input.

Current limit protection and thermal overload protection are intended to protect the device against current overload conditions at the output of the device. For normal operation, the junction temperature should not exceed 125°C .

The input of the device withstands reverse voltages of 20 V. Current flow into the device is limited to less than 1 mA (typically less than $100 \mu\text{A}$), and no negative voltage appears at the output. The device protects both itself and the load. This provides protection against batteries that can be plugged in backward.

The output of the TL1963A-xx can be pulled below ground without damaging the device. If the input is left open circuit or grounded, the output can be pulled below ground by 20 V. For fixed voltage versions, the output acts like a large resistor, typically $5 \text{ k}\Omega$ or higher, limiting current flow to typically less than $600 \mu\text{A}$. For adjustable versions, the output acts like an open circuit; no current flows out of the pin. If the input is powered by a voltage source, the output sources the short-circuit current of the device and protects itself by thermal limiting. In this case, grounding the SHDN pin turns off the device and stops the output from sourcing the short-circuit current.

The ADJ pin of the adjustable device can be pulled above or below ground by as much as 7 V without damaging the device. If the input is left open circuit or grounded, the ADJ pin acts like an open circuit when pulled below ground and like a large resistor (typically $5 \text{ k}\Omega$) in series with a diode when pulled above ground.

In situations where the ADJ pin is connected to a resistor divider that would pull the ADJ pin above its 7-V clamp voltage if the output is pulled high, the ADJ pin input current must be limited to less than 5 mA. For example, a resistor divider is used to provide a regulated 1.5-V output from the 1.21-V reference when the output is forced to 20 V. The top resistor of the resistor divider must be chosen to limit the current into the ADJ pin to less than 5 mA when the ADJ pin is at 7 V. The 13-V difference between OUT and ADJ divided by the 5-mA maximum current into the ADJ pin yields a minimum top resistor value of $2.6 \text{ k}\Omega$.

In circuits where a backup battery is required, several different input/output conditions can occur. The output voltage may be held up while the input is either pulled to ground, pulled to some intermediate voltage, or is left open circuit.

When the IN pin of the TL1963A-xx is forced below the OUT pin or the OUT pin is pulled above the IN pin, input current typically drops to less than $2 \mu\text{A}$. This can happen if the input of the device is connected to a discharged (low voltage) battery and the output is held up by either a backup battery or a second regulator circuit. The state of the SHDN pin has no effect on the reverse output current when the output is pulled above the input.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

This section will highlight some of the design considerations when implementing this device in various applications.

10.1.1 Output Capacitance and Transient Response

The TL1963A-xx regulators are designed to be stable with a wide range of output capacitors. The ESR of the output capacitor affects stability, most notably with small capacitors. A minimum output capacitor of 10 μF with an ESR of 3 Ω or less is recommended to prevent oscillations. Larger values of output capacitance can decrease the peak deviations and provide improved transient response for larger load current changes. Bypass capacitors, used to decouple individual components powered by the TL1963A-xx, increase the effective output capacitor value.

Extra consideration must be given to the use of ceramic capacitors. Ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior over temperature and applied voltage. The most common dielectrics used are Z5U, Y5V, X5R and X7R. The Z5U and Y5V dielectrics are good for providing high capacitances in a small package, but exhibit strong voltage and temperature coefficients. When used with a 5-V regulator, a 10- μF Y5V capacitor can exhibit an effective value as low as 1 μF to 2 μF over the operating temperature range. The X5R and X7R dielectrics result in more stable characteristics and are more suitable for use as the output capacitor. The X7R type has better stability across temperature, while the X5R is less expensive and is available in higher values.

Voltage and temperature coefficients are not the only sources of problems. Some ceramic capacitors have a piezoelectric response. A piezoelectric device generates voltage across its terminals due to mechanical stress, similar to the way a piezoelectric accelerometer or microphone works. For a ceramic capacitor, the stress can be induced by vibrations in the system or thermal transients.

10.2 Typical Applications

10.2.1 Adjustable Output Operation

NOTE: All capacitors are ceramic.

Figure 30. Adjustable Output Voltage Operation

Typical Applications (continued)

10.2.1.1 Design Requirements

Table 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage (V_{IN})	5.0 V
Output Voltage (V_{OUT})	2.5 V
Output Current (I_{OUT})	0 A to 1 A
Load Regulation	1%

10.2.1.2 Detailed Design Procedure

The TL1963A has an adjustable output voltage range of 1.21 V to 20 V. The output voltage is set by the ratio of two external resistors R1 and R2 as shown in [Figure 30](#). The device maintains the voltage at the ADJ pin at 1.21 V referenced to ground. The current in R1 is then equal to $(1.21 \text{ V}/R1)$, and the current in R2 is the current in R1 plus the ADJ pin bias current. The ADJ pin bias current, 3 μA at 25°C, flows through R2 into the ADJ pin. The output voltage can be calculated using [Equation 1](#).

$$V_{OUT} = 1.21\text{V}\left(1 + \frac{R2}{R1}\right) + I_{ADJ} \times R2 \quad (1)$$

The value of R1 should be less than 4.17 k Ω to minimize errors in the output voltage caused by the ADJ pin bias current. Note that in shutdown the output is turned off, and the divider current is zero. For an output voltage of 2.50 V, R1 will be set to 4.0 k Ω . R2 is then found to be 4.22 k Ω using the equation above.

$$V_{OUT} = 1.21\text{V}\left(1 + \frac{4.22\text{k}\Omega}{4.0\text{k}\Omega}\right) + 3\mu\text{A} \times 4.22\text{k}\Omega \quad (2)$$

$$V_{OUT} = 2.50 \text{ V} \quad (3)$$

The adjustable device is tested and specified with the ADJ pin tied to the OUT pin for an output voltage of 1.21 V. Specifications for output voltages greater than 1.21 V are proportional to the ratio of the desired output voltage to 1.21 V: $V_{OUT}/1.21 \text{ V}$. For example, load regulation for an output current change of 1 mA to 1.5 A is –2 mV (typ) at $V_{OUT} = 1.21 \text{ V}$. At $V_{OUT} = 2.50 \text{ V}$, the typical load regulation is:

$$(2.50 \text{ V}/1.21 \text{ V})(-2 \text{ mV}) = -4.13 \text{ mV} \quad (4)$$

[Figure 33](#) shows the actual change in output is ~3 mV for a 1A load step. The maximum load regulation at 25 °C is –8 mV. At $V_{OUT} = 2.50 \text{ V}$, the maximum load regulation is:

$$(2.50 \text{ V}/1.21 \text{ V})(-8 \text{ mV}) = -16.53 \text{ mV} \quad (5)$$

Since 16.53 mV is only 0.7% of the 2.5 V output voltage, the load regulation will meet the design requirements.

10.2.1.2.1 Fixed Operation

The TL1963A-xx can be used in a fixed voltage configuration. The SENSE/ADJ pin should be connected to OUT for proper operation. An example of this is shown in [Figure 31](#). The TL1963A can also be used in this configuration for a fixed output voltage of 1.21 V.

Figure 31. 3.3-V to 2.5-V Regulator

During fixed voltage operation, the SENSE/ADJ pin can be used for a Kelvin connection if routed separately to the load. This allows the regulator to compensate for voltage drop across parasitic resistances (RP) between the output and the load. This becomes more crucial with higher load currents.

Figure 32. Kelvin Sense Connection

10.2.1.3 Application Curve

Figure 33. 1-A Load Transient Response ($C_{OUT} = 10 \mu F$)

10.2.2 Paralleling Regulators for Higher Output Current

NOTE: All capacitors are ceramic.

Figure 34. Paralleling Regulators For Higher Output Current

10.2.2.1 Design Requirements

Table 3. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage (V_{IN})	6.0 V
Output Voltage (V_{OUT})	3.3 V
Output Current (I_{OUT})	3.0 A

10.2.2.2 Detailed Design Procedure

In an application requiring higher output current, an adjustable output regular can be placed in parallel with a fixed output regulator to increase the current capacity. Two sense resistors and a comparator can be used to control the feedback loop of the adjustable regulator in order to balance the current between the two regulators.

In [Figure 34](#) resistors R1 and R2 are used to sense the current flowing into each regulator and should have a very low resistance to avoid unnecessary power loss. R1 and R2 should have the same value and a tolerance of 1% or better so the current is shared equally between the regulators. For this example, a value of 0.01 Ω will be used.

The TLV3691 rail-to-rail nanopower comparator output will alternate between VIN and GND depending on the currents flowing into each of the two regulators. To design this control circuit, begin by looking at the case where the two output currents are approximately equal and the comparator output is low. In this case, the output of the TL1963A should be set the same as the fixed voltage regulator. The TL1963A-33 has a 3.3 V fixed output, so this will be the set point for the adjustable regulator. Begin by selecting a R7 value less than 4.17 kΩ. In this example, 3.3 kΩ will be used. R5 will need to have a high resistance to satisfy Equation 10, for this example 100 kΩ was chosen. Then find the parallel resistance of R5 and R7 since they are both connected from the ADJ pin to GND using Equation 6.

$$(R5 || R7) = \frac{R5 \times R7}{R5 + R7} = 3.19\text{k}\Omega \quad (6)$$

Once the R5 and R7 parallel resistance is calculated, the value for R6 can be found using Equation 7.

$$R6 = \frac{V_{OUT}}{1.22V} (R5 || R7) - (R5 || R7) \quad (7)$$

$$R6 = \frac{3.3V}{1.22V} (3.19\text{k}\Omega) - (3.19\text{k}\Omega) \quad (8)$$

$$R6 = 5.45\text{ k}\Omega \quad (9)$$

In the case where the TL1963A-33 is sourcing more current than TL1963A, the comparator output will go high. This will lower the voltage at the ADJ pin causing the TL1963A to try and raise the output voltage by sourcing more current. The TL1963A-33 will then react by sourcing less current to try and keep the output from rising. When the current through the TL1963A-33 becomes less than the TL1963A, the comparator output will return to GND. In order for this to happen, Equation 10 must be satisfied:

$$V_{IN} \left(\frac{R7}{R5 + R7} \right) + (V_{IN} - V_{OUT}) \left(\frac{R6}{R5 + R6} \right) < V_{ref} \quad (10)$$

$$6V \left(\frac{3.3\text{k}\Omega}{100\text{k}\Omega + 3.3\text{k}\Omega} \right) + (2.7V) \left(\frac{5.45\text{k}\Omega}{100\text{k}\Omega + 5.45\text{k}\Omega} \right) < 1.21V \quad (11)$$

$$0.19\text{ V} + 0.14\text{ V} < 1.21\text{ V} \quad (12)$$

$$0.33\text{ V} < 1.21\text{ V} \quad (13)$$

10.2.2.3 Application Curve

Figure 35. Parallel Regulators Sharing Load Current

11 Power Supply Recommendations

The device is designed to operate with an input voltage supply up to 20 V. The minimum input voltage should provide adequate headroom greater than the dropout voltage in order for the device to have a regulated output. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

12 Layout

12.1 Layout Guidelines

- For best performance, all traces should be as short as possible.
- Use wide traces for IN, OUT, and GND to minimize the parasitic electrical effects.
- A minimum output capacitor of 10 μF with an ESR of 3 Ω or less is recommended to prevent oscillations. X5R and X7R dielectrics are preferred.
- Place the Output Capacitor as close as possible to the OUT pin of the device.
- The tab of the DCQ package should be connected to ground.
- The exposed thermal pad of the KTT package should be connected to a wide ground plane for effective heat dissipation.

○ Via to GND Plane

Figure 38. 4SOT-223 Layout Example (DCY)

12.3 Thermal Considerations

The power handling capability of the device is limited by the recommended maximum operating junction temperature (125°C). The power dissipated by the device is made up of two components:

- Output current multiplied by the input/output voltage differential: $I_{OUT}(V_{IN} - V_{OUT})$
- GND pin current multiplied by the input voltage: $I_{GND}V_{IN}$

The GND pin current can be found using the GND Pin Current graphs in [Typical Characteristics](#). Power dissipation is equal to the sum of the two components listed above.

Thermal Considerations (continued)

The TL1963A-xx series regulators have internal thermal limiting designed to protect the device during overload conditions. For continuous normal conditions, the recommended maximum operating junction temperature is 125 °C. It is important to give careful consideration to all sources of thermal resistance from junction to ambient. Additional heat sources mounted nearby must also be considered.

For surface-mount devices, heat sinking is accomplished by using the heat-spreading capabilities of the PC board and its copper traces. Copper board stiffeners and plated through-holes can also be used to spread the heat generated by power devices.

Table 4 lists thermal resistance for several different board sizes and copper areas. All measurements were taken in still air on 1/16" FR-4 board with 1-oz copper.

Table 4. Thermal Data for KTT Package (5-Pin TO-263)

COPPER AREA		BOARD AREA	THERMAL RESISTANCE (JUNCTION TO AMBIENT)
TOPSIDE ⁽¹⁾	BACKSIDE		
2500 mm ²	2500 mm ²	2500 mm ²	23°C/W
1000 mm ²	2500 mm ²	2500 mm ²	25°C/W
125 mm ²	2500 mm ²	2500 mm ²	33°C/W

(1) Device is mounted on topside.

12.3.1 Calculating Junction Temperature

Example: Given an output voltage of 3.3 V, an input voltage range of 4 V to 6 V, an output current range of 0 mA to 500 mA, and a maximum ambient temperature of 50°C, what is the operating junction temperature?

The power dissipated by the device is equal to:

$$I_{OUT(MAX)}(V_{IN(MAX)} - V_{OUT}) + I_{GND}(V_{IN(MAX)})$$

where

- $I_{OUT(MAX)} = 500 \text{ mA}$
 - $V_{IN(MAX)} = 6 \text{ V}$
 - I_{GND} at ($I_{OUT} = 500 \text{ mA}$, $V_{IN} = 6 \text{ V}$) = 10 mA
- (14)

So,

$$P = 500 \text{ mA} \times (6 \text{ V} - 3.3 \text{ V}) + 10 \text{ mA} \times 6 \text{ V} = 1.41 \text{ W}$$
(15)

Using a KTT package, the thermal resistance is in the range of 23°C/W to 33°C/W, depending on the copper area. So the junction temperature rise above ambient is approximately equal to:

$$1.41 \text{ W} \times 28^\circ\text{C/W} = 39.5^\circ\text{C}$$
(16)

The junction temperature rise can then be added to the maximum ambient temperature to find the operating junction temperature (T_J):

$$T_J = 50^\circ\text{C} + 39.5^\circ\text{C} = 89.5^\circ\text{C}$$
(17)

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

DCY (R-PDSO-G4)

PLASTIC SMALL-OUTLINE

- NOTES: A. All linear dimensions are in millimeters (inches).
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion.
 D. Falls within JEDEC TO-261 Variation AA.

KTT (R-PSFM-G5)

PLASTIC FLANGE-MOUNT PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-SM-782 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
 - This package is designed to be soldered to a thermal pad on the board. Refer to the Product Datasheet for specific thermal information, via requirements, and recommended thermal pad size. For thermal pad sizes larger than shown a solder mask defined pad is recommended in order to maintain the solderable pad geometry while increasing copper area.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
